

Dear Mr Johnson

In my opinion, you should consider redirecting our taxes from high speed trains and space programmes to more agriculture, therefore less importing and more local food. You should also be redirecting it to insulation. This is because people would not burn fossil fuels to create warmth in their houses. It would also help the economy because people would not be spending money on warming their house.

Different types of energy, like wind, solar and water energy need to be funded a lot more, coal is going to run out very soon. The amount of thermal energy in the sea is vast but nobody is realising. This would really help the environment. I know that you have made a law by 2030 to make the manufacturing of petrol cars illegal but you must implement that and not just say it. Electric cars are going to become the norm in the near future, there is really no point in making people buy electric cars if the electric you are charging it with is coal, and not a renewable energy source because you are still polluting. Car charging ports have to become more accessible in petrol stations but also in lampposts. I have only ever seen one port in a lamppost in my whole life.

Public transport has to be improved and the government have to fund into making people feel inclined to go on public transport. At first, make trains and buses nicer, more comfortable, air circulation, free wifi, faster etc. but then, if this does not work, either rise prices for petrol cars until 2030, rise prices for petrol and rise taxes in the ULEZ and traffic congestion zones.

How about not taking private jets to and from Glasgow when you could go on a train or some sort of public transport?

Hopefully you might take my suggestions into account and reply to my letter.

Yours hopefully,
Zubin S
